

COLLEGE OF ENGINEERING AND COMPUTATIONAL SCIENCES
COMPUTATIONAL SCIENCES DEPARTMENT

FINAL PROJECT: INDIVIDUAL NARRATIVE REPORT

HCI2 – HUMAN-COMPUTER INTERACTION

PROJECT OVERVIEW:

This report presents my individual contribution to our group’s final project in HCI2, which involves the development of a static web reporting site documenting the usability evaluation of our prototype. The report outlines the tasks assigned to me, the objectives of each task, and the deliverables I produced. It also includes supporting evidence of my contributions, the process I followed in completing my responsibilities, and the challenges I encountered along the way.

Through this report, I aim to provide a clear and truthful account of my participation in the project. It also serves as a basis for evaluating my performance in terms of the number of tasks I completed, the accuracy with which I performed them, and the quality of the outputs I produced.

LEARNING OBJECTIVES:

The objectives of this individual narrative report are as follows:

- 1. To clearly identify and document the specific tasks assigned to me in the completion of the project.
- 2. To explain the purpose or objective of each task and the expected deliverables associated with it.
- 3. To present the actual outputs I produced and how they contributed to the overall project.
- 4. To provide verifiable evidence supporting my contributions.
- 5. To describe the process I followed in completing my tasks, including coordination with my group members.
- 6. To reflect on the challenges I encountered and how I addressed them during the project.

MEMBER INFORMATION:

Name:	Angel Lito Bonaga	Date:	May 17, 2026
Project Title:	e-hiwakloy	Course/Year& Section:	BSIT-3C

TASK ASSIGNMENT:

Task No.	Task Title	Task Objective	Task Description
1	UI Simplification: Removal of Redundant Back Buflon	To improve user interface clarity and navigation flow by removing unnecessary and repetitive back navigation elements in the password recovery screens.	The bottom “Back” button was removed from the Forgot Password, Verify Code, Create New Password, and Confirm Password screens. This change was implemented because a navigation option (such

			as returning to login or previous screen) was already available in other parts of the interface. Removing the redundant button helps reduce visual clutter, avoids user confusion, and enhances the overall user experience by maintaining a cleaner and more streamlined layout.
2	UI Standardization and Layout Alignment	To ensure visual consistency and improve user experience by aligning the design elements, layout structure, button placement, and color scheme with the system’s main design and predefined color library.	The appointment details interface was refined by aligning all UI components with the main application design. This includes adjusting layout spacing, repositioning buttons (such as “Reschedule Appointment” and “Cancel Appointment”), and ensuring consistent sizing and alignment of elements across different appointment types (General Consultation, Vaccination, Maternal Care, and Health Checkup). Additionally, the color scheme was standardized using the predefined color library to maintain uniformity across screens. Visual elements such as cards,

			icons, and status labels were updated to follow the same design language, resulting in a more cohesive and professional interface.
3	DesignSystem Alignment for Schedule Appointment Module	To achieve consistency and usability across the application by aligning the Schedule Appointment module’s layout, date and time selection components, buttons, and icons with the main (leader) design system.	The Schedule Appointment interface was updated to match the main application’s design standards. The layout structure was reorganized to ensure consistent spacing, alignment, and hierarchy across all appointment types (Consultation, Vaccination, Maternal Care, and Health Checkup). The date and time selection components were redesigned and aligned with the leader design, replacing inconsistent input styles with a unified selection interface. Buttons such as “Confirm Appointment” were standardized in size, color, and placement to maintain uniformity across screens. Additionally, icons and visual elements were updated to match the system’s icon set and color library, ensuring a

			cohesive and professional appearance. These improvements enhance user experience by providing a predictable and visually consistent interface throughout the scheduling process.
4	UI Alignment and Standardization for Cancel Appointment Module	To improve usability and maintain design consistency by aligning the Cancel Appointment module’s layout, buttons, and visual elements with the main (leader) design system.	The Cancel Appointment interface was updated to follow the main application design standards. Layout elements such as appointment details, spacing, and card structure were aligned with the leader design to ensure uniformity across all appointment types (Consultation, Vaccination, Maternal Care, and Health Checkup). Buttons such as “No, Keep Appointment” and “Yes, Cancel Appointment” were standardized in terms of size, placement, and color to clearly distinguish primary and secondary actions. Additional UI elements such as reminder messages and contact sections were also

			repositioned and styled consistently based on the design system. These improvements enhance visual hierarchy, reduce user confusion, and create a more cohesive and user-friendly cancellation flow.
5	UI Enhancement for Appointment Cancellation Confirmation Screen	To improve user feedback and interface consistency by redesigning the cancellation confirmation screen and aligning it with the main design system.	The Appointment Cancellation Confirmation screen was improved to provide clearer feedback to users after successfully canceling an appointment. The layout was aligned with the main design system to ensure consistency in spacing, typography, and component structure across all appointment types (Consultation, Vaccination, Maternal Care, and Health Checkup). A clear success indicator (icon and message) was emphasized to confirm the cancellation action. Appointment details were reorganized for better readability, and action buttons such as “Back to Appointment Details” and “Book New Appointment” were

			standardized in terms of placement, size, and color. These changes enhance user confidence by clearly communicating the result of their action while maintaining a clean and consistent interface.
6	Services Module Redesign and Layout Alignment	To improve usability and navigation by redesigning the Services screen and aligning its layout, components, and visual elements with the main (leader) design system.	The Services screen, accessed when users click the Services icon, was redesigned to improve structure, clarity, and user interaction. Service options such as Consultation, Vaccination, Maternal Care, and Health Checkup were reorganized into a more consistent and visually balanced layout. The Upcoming Appointment section was updated to follow the standard card design used across the system, ensuring consistency in spacing, typography, and information hierarchy. Additional elements such as appointment reminders and contact options were repositioned for better accessibility and alignment. A primary action button

			("Book Appointment") was added and emphasized to guide users toward scheduling services. All UI components—including icons, colors, and spacing—were standardized based on the design system, resulting in a cleaner, more intuitive, and user-friendly interface.
7	Profile and Settings Module Redesign and Standardization	To enhance usability and improve information organization by redesigning the Profile and Settings screen and aligning it with the main design system.	The Profile and Settings screen was redesigned to improve layout structure, clarity, and user interaction. The user profile section was enhanced by updating the layout to display essential user information more clearly, including name, email, and contact details. Settings options were reorganized into a structured and categorized format, including sections such as appointment management (Upcoming, Completed, Cancelled), account settings (Change Password), and system-related options (Terms and Privacy Policy).

			This restructuring improves navigation and allows users to quickly access specific features. Additional elements such as appointment reminders and contact support were integrated into the layout for better accessibility. The logout button was redesigned and repositioned to make it more visible and consistent with the overall design system. All components—including icons, spacing, and colors—were standardized to ensure a cohesive and user-friendly interface.
8	Prototype Navigation Flow Integration and Connection	To ensure smooth and functional user interaction by connecting all screens and establishing a complete and consistent navigation flow within the prototype.	The prototype initially had incomplete and unconnected screen transitions, which affected the overall user flow and interaction. This task involved linking all screens and components to create a fully functional navigation system. All buttons, interactive elements, and user actions were connected to their corresponding destination screens, including flows for appointment scheduling, cancellation, profile management, and

			services navigation. Missing links were identified and corrected to prevent dead ends and broken navigation paths. The final result is a fully connected prototype that accurately represents real user interaction, allowing seamless movement across all features and ensuring a complete end-to-end user experience.
9	Creation of Centralized Color Style Library (Design System)	To establish a consistent and reusable visual design standard by creating a centralized color style library for the entire application.	As a team leader, a centralized color style library was created to standardize the application’s visual identity and ensure consistency across all UI components. The color system includes primary, secondary, and supporting colors, as well as specific colors for different service categories such as Vaccination and Maternal Care. Each color was defined and saved as a reusable style, allowing team members to apply consistent colors across all screens efficiently. This approach minimizes design inconsistencies, improves follow a

			unified theme aligned with the overall design system. collaboration, and simplifies future updates to the UI. The implementation of a color library ensures that all design elements
10	Respondent Selection & Sample Size Computation	To identify appropriate respondents and determine the required sample size for usability testing	Selected 67 students from Values Education (1st–3rd year) as respondents. Applied Slovin’s Formula with 10% margin of error, resulting in 40 respondents needed for usability testing.
11	Survey Questionnaire & Task Scenario Preparation	To develop structured survey instruments and usability tasks	Finalized survey questionnaire based on instructor’s format. Created 10 tasks and scenarios (e.g., booking an appointment) for respondents. Printed survey forms and task instructions.
12	Data Gathering Execution	To conduct usability testing and collect data from respondents	Coordinated with respondents and scheduled data gathering. Oriented participants about the system, confidentiality, and procedures. Assisted respondents while using the system and answering surveys. Completed 25 responses on April 21 and 15 additional responses on Apr 22, 2026 to complete the 40 needed respondents.
13	Documentation of Data Gathering	To record and provide evidence of the data gathering process needed	Captured photos and videos during preparation, actual testing, and respondent interaction.

		for creating a Web Reporting Site Final Project	Collected completed survey forms and documented the activity.
14	Homepage UI Development and Design Implementation	To develop a premium and user-friendly homepage interface for the web reporting system aligned with the system design standards.	The homepage of the e-Hiwacloy web reporting system was developed based on the provided mockup design. The layout includes a glass-style header, hero section with proper image positioning, and a structured team section. Design elements such as typography, spacing, and alignment were implemented to ensure a clean and professional interface.
15	UI Refinement and Output Standardization	To improve the quality, consistency, and completeness of submitted outputs from team members.	One of the submitted homepage outputs did not meet the expected design standard. The interface was reviewed and refined by correcting layout alignment, improving spacing, adjusting typography, and ensuring consistency with the design system. The output was polished to achieve a more professional and cohesive design.
16	Implementation of Design System (Color and Layout Consistency)	To maintain visual consistency across the interface using a standardized color scheme and layout structure.	A consistent color palette (primary green, light green, and gray tones) was applied across the homepage. UI components such as cards, text, and navigation elements were aligned with the

			established design system to ensure uniformity and improve visual hierarchy.
17	Layout Enhancement and Section Transition Improvement	To improve user experience by eliminating unnecessary spacing and enhancing section transitions.	The empty space between the hero and team section was removed and replaced with a smooth curved transition design. The team section was adjusted upward to improve visibility and maintain layout continuity.
18	Team Section UI Enhancement	To improve the presentation and structure of team member information using a premium card layout.	The team section was redesigned using a consistent card layout. The team leader card was emphasized and aligned with member cards in terms of size and spacing. Profile images were styled in circular format, and text elements were standardized for readability and consistency.
19	Navigation and Interaction Improvement	To enhance usability and prevent interface issues such as flickering and unstable navigation.	The dropdown menu behavior was improved to remain stable during hover interaction. Navigation transitions were optimized to prevent screen blinking or flickering. Hover effects were added to improve interactivity and user feedback.

20	Task Delegation and Team Coordination	To efficiently manage group tasks and ensure all members understand their assigned responsibilities.	Tasks were distributed among group members including homepage development, data gathering page, results page, and additional pages. Guidance and mockup designs were provided to ensure clarity of expectations. Additional tasks such as SUS computation and survey summary were also assigned.
21	Homepage Visual Design Enhancement	To improve the visual appearance and professionalism of the homepage interface through consistent branding and modern UI design elements.	The homepage of the e-Hiwacloy web reporting system was enhanced by refining the overall visual presentation of the interface. Improvements included updating the system logo, refining the glassmorphism header design, adjusting navigation alignment, and enhancing the homepage background image to create a cleaner and more professional appearance. Typography, color harmony, and spacing were also improved to strengthen visual hierarchy and branding consistency throughout the homepage interface.
22	Header and Navigation Bar Refinement	To enhance user navigation and maintain a clean and organized interface layout.	The header section and navigation bar were refined by improving menu spacing, alignment,

			and responsiveness. Navigation elements such as Home, Data Gathering, Results, and More were properly positioned to ensure accessibility and usability. The transparent glass-style header was also optimized to improve readability while maintaining a modern user interface design.
23	Homepage Background and Branding Improvement	To create an engaging and visually appealing homepage aligned with the healthcare system theme.	The homepage background image was updated and positioned properly to match the healthcare concept of the e-Hiwacloy system. Visual elements such as the healthcare facility illustration, landscape background, and branding colors were balanced to create a welcoming and user-friendly environment. The official logo and title placement were also improved to strengthen system identity and presentation quality.
24	Team Section Interface Development	To develop a visually organized and professional team section that presents the members of the e-Hiwacloy development team.	The team section of the e-Hiwacloy web reporting system was designed and implemented using a card-based layout to properly present the team leader and members. The interface includes profile images, names, student

			numbers, quotations, and role labels to provide complete and organized information about each developer involved in the project.
25	Team Card Design and Layout Enhancement	To improve visual consistency, alignment, and readability of team member information.	The team cards were refined by adjusting spacing, alignment, typography, and image placement to maintain a clean and balanced layout. Circular profile images, consistent card dimensions, and green accent colors were applied to achieve a professional appearance aligned with the healthcare theme of the system.
26	Interactive Contribution Button Implementation	To provide interactive functionality that allows users to access the contribution details of each team member.	Functional buttons for the Team Leader and Team Member sections were implemented to display the PDF file containing the documented contributions of each member in the project. Button interactions were tested to ensure accessibility, proper linking, and smooth navigation when opening the assigned contribution files.
27	Footer and Information Presentation Enhancement	To improve the structure and completeness of the homepage interface through organized informational components.	The footer section was added and styled to provide proper project attribution and improve the overall structure of the

			homepage. Additional refinements were also made to the placement of text elements such as names, quotations, student IDs, and role labels to strengthen readability and visual hierarchy.
28	Data Gathering Page Interface Development	To design and develop a dedicated Data Gathering page for presenting research and usability evaluation information in an organized manner.	The Data Gathering page of the e-Hiwacloy web reporting system was developed to serve as a section containing the essential documentation and collected data related to the usability evaluation of the system. The page layout was structured to provide a clean and professional presentation while maintaining consistency with the overall design of the website.
29	Data Gathering Page Visual Enhancement	To improve the visual appearance and readability of the Data Gathering section using consistent UI design elements.	The interface of the Data Gathering page was enhanced through the application of consistent typography, spacing, alignment, and color styling. The healthcare-themed background image, header layout, and navigation elements were refined to maintain visual consistency with the homepage and strengthen the overall user experience.

30	Navigation and Section Integration Improvement	To ensure smooth navigation and proper integration of the Data Gathering page within the web reporting system.	Navigation elements and menu highlighting were implemented to clearly indicate the active Data Gathering page. Adjustments were also made to section placement and text positioning to improve accessibility, readability, and user interaction throughout the interface.
31	Consent Form Section Development	To create a dedicated section for presenting the consent forms used in the usability evaluation process.	A Consent Form section was developed and integrated into the Data Gathering page to provide access to the signed consent forms of participants involved in the study. The section includes a structured card layout, descriptive text, numbering indicator, and an interactive button for viewing the uploaded PDF document.
32	Respondents Information Section Implementation	To organize and present participant profile information in a clear and accessible interface.	The Respondents Information section was implemented using a card-based design containing participant-related descriptions and an interactive button for accessing the respondents' profile documentation. Consistent spacing, typography, and color styling were applied to

			maintain visual uniformity within the Data Gathering page.
33	PDF Viewing Functionality Integration	To provide interactive access to uploaded research documents and evaluation files within the website.	Interactive buttons were configured to open PDF files containing the consent forms and respondents' information. The PDF viewing functionality was tested to ensure proper navigation, accessibility, and accurate display of uploaded documents directly within the web reporting system interface.
34	Respondents Visualization Dashboard Development	To develop an interactive dashboard that visually presents the demographic and research-related data gathered from the respondents.	A Respondents Visualization Dashboard was designed and implemented to display summarized respondent information using statistical cards and graphical visualizations. The dashboard presents data such as total population, sample size, respondents' course, and sampling method in a clean and organized interface.
35	Data Visualization and Graph Integration	To improve data interpretation and presentation through graphical representations and charts.	Multiple charts and graphical components were integrated into the dashboard to visually represent respondent demographics and technology usage data. These include Age Distribution, Gender

			Distribution, Program Distribution, Year Level Distribution, Experience with Similar Systems, and Frequency of Technology Use. The graphs were styled using a consistent green-themed design aligned with the visual identity of the system.
36	Sampling Method and Statistical Presentation Enhancement	To present the sampling computation and statistical methodology used in the study in a visually understandable format.	A dedicated section for the Slovin’s Formula sampling method was implemented within the dashboard. The formula, population size, margin of error, and computed sample size were visually arranged to improve readability and understanding of the statistical process used in the research study.
37	Survey Instruments Section Development	To create a dedicated section for organizing and presenting the research instruments used in the usability evaluation.	A Survey Instruments section was developed within the Data Gathering page to provide organized access to the Heuristic Evaluation Workbook, SUS Questionnaire, and Task Scenarios used during the evaluation process. The section was designed using card-based layouts with icons, descriptions, and interactive buttons for improved accessibility and presentation.

38	Documentation Gallery and File Organization Implementation	To organize project-related documentation and supporting materials in a visually structured layout.	A documentation gallery section was implemented to display photos during testing, supporting files, and related documents in a structured grid layout. The design was enhanced using consistent card styling, image placement, spacing, and alignment to improve organization and visual presentation of the uploaded materials.
39	Documentation Gallery and File Organization Implementation	To organize project-related documentation and supporting materials in a visually structured layout.	A documentation gallery section was implemented to display photos during testing, supporting files, and related documents in a structured grid layout. The design was enhanced using consistent card styling, image placement, spacing, and alignment to improve organization and visual presentation of the uploaded materials.
40	Supporting Documents and External File Integration	To provide direct access to important research files and supporting project documents within the system.	Interactive document cards were integrated for accessing the Survey Response Records, Raw Response Dataset, and HCI2 Final Project Guide. Functional buttons were configured to allow users to open and view the uploaded PDF files, datasets, and supporting

			documents directly from the website interface.
41	Results and Recommendations Page Development	To develop a dedicated page for presenting the usability evaluation results and recommendations of the e-Hiwacloy system.	The Results and Recommendations page of the e-Hiwacloy web reporting system was developed to display the summarized usability findings, SUS evaluation results, and system recommendations in a visually organized interface. The page was structured to provide a professional presentation of evaluation outputs and research findings.
42	Results Page Visual Design Enhancement	To improve the visual presentation and consistency of the Results and Recommendations interface.	The interface design of the Results page was enhanced through improvements in typography, spacing, alignment, text hierarchy, and background positioning. The healthcare-themed background image, navigation bar, and content placement were refined to maintain consistency with the overall visual identity of the website.
43	Navigation Highlighting and Layout Optimization	To improve usability and user orientation within the Results section of the system.	Navigation elements were configured to properly highlight the active Results page for improved user navigation and accessibility. Layout adjustments were also

			applied to ensure balanced spacing, organized text placement, and a cleaner presentation of the Results and Recommendations section.
44	System Usability Scale (SUS) Results Visualization	To present the System Usability Scale evaluation results in a visually understandable and organized format.	A dedicated SUS Results section was implemented within the Results and Recommendations page to display the overall usability rating of the e-Hiwacloy system. Graphical visualizations such as score indicators and response distribution charts were integrated to improve interpretation and presentation of the collected SUS evaluation data.
45	Task Completion Analytics Dashboard Development	To analyze and visually present task performance metrics gathered during usability testing.	A Task Completion Analytics section was developed to display the completion time analysis and overall task performance of respondents during system testing. Bar graphs and performance metric cards were integrated to present task success rate, average completion time, most time-consuming task, and fastest completed task in a structured and accessible format.

...Add more rows if necessary

EVIDENCE OF CONTRIBUTIONS:

This section provides proof of the tasks I completed. Each piece of evidence corresponds to a specific task listed above.

Note: All evidence should be properly labeled

Screenshot/Images	Descriptions
	The interface originally included a “Back” button at the bottom of each screen. This created redundancy since navigation options were already available elsewhere (e.g., top navigation or login link), making the layout slightly cluttered. The bottom “Back” button was successfully removed, resulting in a cleaner and more focused interface. The layout now emphasizes primary actions (e.g., Verify Code, Set New Password, Update Password), improving usability and visual hierarchy.
	The initial design showed inconsistencies in layout alignment, button placement, and color usage. Some elements were not properly aligned with the main interface, and button styles varied, resulting in a less cohesive user experience. The updated design now follows a consistent layout and design system. Buttons are properly aligned and uniformly styled, spacing is balanced, and colors are standardized based on the application’s color library. This results in a cleaner, more professional, and user-friendly interface.
	The original design showed inconsistencies in layout structure, date and time selection components, and button alignment. Different styles were used across screens, making the interface less cohesive and slightly confusing for users. The updated interface now follows the main design system. The layout is properly aligned, date and time selectors are uniform, and buttons and icons are consistent across all appointment types. This results in a cleaner, more intuitive, and user-friendly scheduling experience.

The original interface showed inconsistencies in layout alignment, spacing, and button styling. Action buttons were not clearly distinguished, and some elements were not aligned with the overall system design, affecting usability and clarity.

The updated design now aligns with the main design system. Buttons are clearly distinguished using consistent colors (green for keeping the appointment and red for cancellation), layout spacing is improved, and all elements follow a unified structure. This results in a clearer and more intuitive user experience.

The original confirmation screen displayed the cancellation message but lacked clear visual hierarchy. Elements were not fully aligned with the main design, and the feedback presentation was less structured, making it harder for users to quickly understand the result.

The updated design clearly emphasizes the cancellation status using a strong visual indicator and structured layout. Appointment details are neatly organized, and action buttons are consistently styled and positioned. This improves clarity, usability, and overall user experience.

The original Services screen had inconsistencies in layout structure, spacing, and component alignment. Service cards and sections were not fully aligned with the main design system, and there was no strong emphasis on the primary user action.

The updated Services screen now follows a consistent layout aligned with the design system. Service options are clearly organized, the Upcoming Appointment section is visually improved, and a prominent “Book Appointment” button enhances user navigation and interaction. The interface is now cleaner, more structured, and easier to use.

The original Profile and Settings screen had a basic layout with limited structure. Options were listed without clear grouping, and the visual hierarchy was not well defined, making navigation less intuitive.

The updated design features a well-structured layout with clearly grouped settings options. The profile section is more visually prominent, and navigation is improved through categorized options and consistent UI elements. The overall interface is cleaner, more organized, and user-friendly.

The prototype initially contained multiple screens that were not properly connected. Several interactions were missing, resulting in incomplete user flows and navigation issues such as dead ends and non-functional buttons.

All screens are now fully connected, with complete navigation paths across the entire system. Interactive elements correctly link to their respective destinations, ensuring smooth and continuous user flow throughout the prototype.

	A centralized color style library was created in the design tool, defining primary, secondary, and category-specific colors. These styles are reusable across all screens, ensuring consistency and efficiency in the design process.
	The E-Hiwacloy team prepared the venue, laptops, and system prototype before the start of data gathering.
	Respondents were gathered and oriented about the system, including instructions, confidentiality, and purpose of the study.
	Participants interacted with the E-Hiwacloy system by performing assigned tasks such as booking appointments.

Respondents answered the printed questionnaire while using the system.

Researchers guided respondents and answered questions regarding system usage.

Completed survey forms were collected after respondents finished the tasks.

The group returned on April 22 to complete the remaining 15 respondents within one hour.

The initial homepage output showed inconsistencies in layout alignment, spacing, and visual hierarchy. Some elements were not properly positioned, and the design lacked uniformity in typography and color usage. The interface appeared less structured and did not fully follow the expected design standards, resulting in a less professional presentation.

The refined homepage design now follows a consistent and professional layout aligned with the system's design standards. The header was enhanced using a glassmorphism effect, improving visual appeal and navigation clarity. The hero section was properly aligned, with corrected background positioning and centered text for better readability.

The transition between the hero and team section was improved by removing unnecessary spacing and adding a smooth curved design, creating a seamless visual flow. The team section was redesigned using uniform card layouts, ensuring consistent size, spacing, and alignment for both leader and members.

Typography and color usage were standardized based on the design system, enhancing visual hierarchy and readability. Interactive elements such as hover effects and dropdown behavior were also improved, resulting in a more stable and user-friendly interface.

Overall, the updated design is cleaner, more organized, visually appealing, and aligned with usability principles.

The image shows the actual development process of the homepage of the e-Hiwacloy web reporting system. During this stage, the homepage design was being reviewed and evaluated to ensure that all UI elements such as the header, hero section, and team layout were properly aligned and visually consistent. This step is important in identifying design issues and verifying that the implemented layout matches the intended mockup design.

The image shows the coding phase of the development process where the homepage interface was being implemented using HTML and CSS. Adjustments were made to improve layout alignment, spacing, responsiveness, and overall visual quality. This includes refining the hero section positioning, improving the glassmorphism header, and enhancing the team section design to achieve a more professional and user-friendly interface.

The image shows the updated homepage interface of the e-Hiwacloy Barangay Health Appointment System. The interface was improved by refining the logo placement, enhancing the glassmorphism header design, and organizing the navigation menu for better usability. The homepage background was also updated with a healthcare-themed visual to create a more professional and visually appealing presentation. Typography, spacing, and color consistency were carefully adjusted to strengthen branding identity and improve the overall user experience.

The image shows the finalized Team Leader card of the e-Hiwacloy web reporting system. The section includes a circular profile image, complete name, student number, role label, and personal quotation arranged in a centered and visually balanced layout. Green accent colors and card styling were applied to maintain consistency with the healthcare theme of the system.

Interactive Contribution Button and Footer Design

The image shows the lower section of the homepage interface where the interactive contribution buttons and footer were implemented. The green buttons were configured to open the PDF documentation of each member's project contribution. The footer section was also added to provide proper project identification and improve the completeness of the interface layout.

The image presents the implemented team member cards containing profile images, student information, role labels, and quotations. The cards were designed using consistent spacing, typography, alignment, and color styling to achieve a professional and organized presentation of the development team.

The image shows the implemented Data Gathering page of the e-Hiwacloy web reporting system. The interface includes a healthcare-themed background, structured header navigation, and organized text content describing the purpose of the section. Improvements were made to typography, alignment, spacing, and color consistency to achieve a professional and visually appealing presentation aligned with the overall design system of the project.

Consent Form and Respondents Information Cards

The images show the implemented card sections for Consent Forms and Respondents Information within the Data Gathering page. Each card contains a title, descriptive content, numbering label, and interactive button designed to provide organized access to research documentation. The layout follows the

established green-themed design system of the website to maintain consistency and professionalism.

PDF File Viewing Interface

The image shows the PDF viewer interface that appears after clicking the interactive button within the Data Gathering section. The uploaded consent form document is displayed directly on the website, allowing users to access and review the research documentation conveniently. The functionality was implemented to improve accessibility and provide organized presentation of project-related files.

Respondents Visualization Dashboard Overview

The image shows the implemented Respondents Visualization Dashboard of the e-Hiwacloy web reporting system. The dashboard contains summary cards displaying the total population, sample size, respondents' course, and sampling method used in the study. The interface was designed using organized card layouts, green-themed colors, and consistent spacing to improve clarity and visual presentation.

Demographic Distribution Charts

The image presents graphical visualizations of the respondents' demographic data including Age Distribution, Gender Distribution, Program Distribution, and Year Level Distribution. Pie charts and bar graphs were utilized to provide a more understandable and visually organized interpretation of the collected respondent information.

Technology Usage and Sampling Method Visualization

The image presents graphical visualizations of the respondents' demographic data including Age

	Distribution, Gender Distribution, Program Distribution, and Year Level Distribution. Pie charts and bar graphs were utilized to provide a more understandable and visually organized interpretation of the collected respondent information.
Survey Instruments Section Interface 	The image shows additional dashboard components presenting the respondents' experience with similar systems, frequency of technology use, and the implementation of Slovin's Formula for sample size computation. The visual layout was structured to improve accessibility, readability, and presentation of statistical data within the web reporting system.
Documentation Gallery Layout 	The image presents the documentation gallery section displaying categorized project materials such as photos during testing, supporting files, and related documents. The interface was designed using a grid-based card layout to maintain organization, readability, and consistency throughout the Data Gathering page.
Supporting Documents Interface 	The image shows the Supporting Document section containing accessible project files including Survey Response Records, Raw Response Dataset, and the HCI2 Final Project Guide. Interactive buttons were implemented to allow users to directly open and review the uploaded documents and datasets used in the study.
Results and Recommendations Page Interface 	The image shows the implemented Results and Recommendations page of the e-Hiwacloy web reporting system. The interface contains a healthcare-themed background, organized navigation bar, and structured text presentation introducing the usability metrics and system evaluation results based on SUS and task performance. Improvements were made to the typography, spacing, alignment, and overall visual

hierarchy to achieve a clean, professional, and user-friendly interface consistent with the overall design of the project.

System Usability Scale Results Interface

The image shows the implemented System Usability Scale Results section of the e-Hiwacloy web reporting system. The interface contains a visual SUS score indicator and response distribution graph used to present the usability evaluation results of the system. The layout was designed using organized card components, graphical charts, and consistent green-themed styling to improve readability and data interpretation.

Task Completion Analytics Dashboard

The image presents the Task Completion Analytics section containing graphical representations of respondents’ task performance during usability testing. The interface includes a completion time analysis graph and performance metric cards showing task success rate, average completion time, most time-consuming task, and fastest completed task.

...Add more rows if necessary

WORK PROCESS

This section explains how I carried out each assigned task, including the steps I followed and how I contributed to the group’s overall output.

Task	Process
Removal of Redundant Back Button	Analyzed the interface and identified duplicate navigation elements, particularly the “Back” button located at the bottom of multiple screens. Reviewed the existing navigation flow and confirmed that alternative navigation options (such as returning to login or previous screen) were already available. Removed the redundant button from all affected screens (Forgot Password, Verify Code, Create New Password, and Confirm Password). Tested each screen to ensure that navigation still functions properly without the removed element and that user flow remains uninterrupted
UI Standardization and Layout Alignment (Appointment Details)	Reviewed the main or leader design to identify standard layout structure, spacing, button

	placement, and color usage. Compared the existing Appointment Details screens with the main design to identify inconsistencies. Adjusted alignment of UI components such as cards, text, and buttons to match the standard layout. Standardized button sizes, positions, and styles (e.g., Reschedule and Cancel buttons). Applied the correct color palette based on the system’s color library. Conducted visual checking and testing across different appointment types to ensure consistency and proper alignment.
Design System Alignment for Schedule Appointment Module	Examined the leader design for the correct implementation of scheduling components, including date and time selectors. Identified inconsistencies in the current Schedule Appointment screens, particularly in layout structure and input components. Updated the date and time selection interface to match the standard design format. Realigned UI elements such as doctor information, appointment details, and input fields to maintain consistent spacing and hierarchy. Standardized icons and buttons according to the design system. Performed final testing to ensure all elements are visually consistent and function correctly across all appointment categories.
UI Alignment and Standardization for Cancel Appointment Module	Reviewed the main or leader design to identify the correct layout structure, spacing, and button hierarchy. Compared the existing Cancel Appointment screens with the standard design to identify inconsistencies. Adjusted the layout of appointment details, input fields, and reminder sections to match the main design. Standardized action buttons by applying consistent sizes, positions, and color coding (green for keep, red for cancel). Updated supporting elements such as contact and reminder sections for better alignment and clarity. Conducted final testing to ensure consistency across all appointment types and verified that user interaction flows correctly.
UI Enhancement for Appointment Cancellation Confirmation Screen	Reviewed the existing confirmation screen and identified issues in visual hierarchy and feedback clarity. Analyzed the main or leader design to

	determine the correct layout structure and component arrangement. Reorganized the interface to prioritize the success message and icon for better visibility. Adjusted spacing, typography, and alignment to match the design system. Standardized action buttons by applying consistent styles, sizes, and placement. Ensured appointment details are clearly presented and easy to read. Conducted testing across all appointment types to verify consistency and proper functionality of the updated design.
Services Module Redesign and Layout Alignment	Reviewed the existing Services screen and identified issues in layout alignment, spacing, and lack of clear user guidance. Analyzed the main or leader design to determine the correct structure and hierarchy. Reorganized service options into a consistent grid layout and aligned them with the design system. Updated the Upcoming Appointment section using the standard card design for consistency. Added a primary action button ("Book Appointment") to improve navigation and guide user interaction. Standardized icons, colors, and spacing based on the predefined design system. Conducted testing to ensure consistency, usability, and smooth interaction across the Services module.
Profile and Settings Module Redesign	Reviewed the existing Profile and Settings screen and identified issues in layout structure, grouping, and navigation clarity. Analyzed the main or leader design to determine proper layout hierarchy and component organization. Redesigned the profile section to clearly display user information. Grouped related settings into categories such as appointments, account settings, and system options. Updated icons, spacing, and colors to align with the design system. Repositioned and restyled the logout button for better visibility and consistency. Integrated additional elements such as appointment reminders and contact support into the layout. Conducted testing to ensure usability, consistency, and smooth navigation across the module.
Prototype Navigation Flow Integration	Reviewed the entire prototype to identify unconnected screens and missing interactions. Analyzed the intended user flow for each feature,

	including services, appointments, cancellation, and profile management. Systematically connected all buttons and interactive elements to their corresponding destination screens using prototyping tools. Ensured proper back navigation and forward flow to avoid dead ends. Verified each user path by simulating real interactions within the prototype. Refined and adjusted connections to ensure a smooth, logical, and complete navigation experience across all modules.
Creation of Color Style Library	Analyzed the application’s design requirements and identified the need for a consistent color system. Defined primary, secondary, and supporting colors based on the intended visual identity of the application. Created and saved each color as a reusable style in the design tool. Assigned specific colors for different service categories to improve visual distinction. Applied the color styles across multiple screens to ensure consistency. Guided team members in using the color library and ensured all designs follow the established design system.
Selection of respondents	Coordinated with instructor and selected Values Education students as target respondents.
Sample size computation	Used Slovin’s Formula with 10% margin of error to determine 40 respondents.
Survey and task preparation	Created and finalized survey questionnaire and task scenarios; printed all materials needed.
Coordination with respondents	Communicated with respondents and scheduled the data gathering session.
Setup of environment	Prepared venue, laptops, system prototype, and printed materials.
Conduct of usability testing	Oriented respondents, guided them through tasks, and assisted during system interaction.
Data collection	Distributed and collected survey questionnaires after completion.
Completion of respondents	Conducted a second data gathering session to complete the remaining respondents.
Documentation	Took photos, videos and recorded the entire process as proof of activity
Homepage Development and UI Enhancement of e-Hiwacloy Web Reporting System on	During this week, I assigned specific tasks to my group members to begin the development of our

web reporting site after completing the data gathering phase. I provided them with a mockup design guide to help them clearly visualize the expected output for each page, including the Homepage, Data Gathering, Results, Discussion and Recommendations, and the additional pages under the “More” dropdown menu such as Reflection, Additional Findings, Prototype Walkthrough, and Video Demonstration.

For the homepage, I ensured that each member understood their assigned tasks and the required design standards. I guided them on proper layout structure, alignment, spacing, and consistency to achieve a user-friendly interface.

In addition, I distributed other responsibilities such as computing the SUS (System Usability Scale) and summarizing the responses from the open-ended questions in our survey questionnaire.

After reviewing one of my member’s outputs, I noticed that it did not fully meet the expected design and quality standards. Because of this, I revised and polished the homepage to improve its visual consistency, layout alignment, and overall user interface. Enhancements included refining the hero section positioning, improving the glassmorphism header design, fixing spacing issues, aligning text properly, and redesigning the team section to achieve a more professional and premium appearance.

At present, the homepage is already completed and finalized, while my other group members are still working on their assigned tasks for the remaining pages of the system.

Homepage Visual Enhancement and Branding Improvement of the e-Hiwacloy Web Reporting System

During this phase of development, the homepage interface of the e-Hiwacloy system was refined to improve its visual quality and user experience. The logo design, header layout, and navigation bar were reviewed and adjusted to achieve proper alignment, spacing, and consistency. The glassmorphism effect applied to the header was enhanced to provide a

cleaner and more modern appearance while maintaining readability of navigation elements.

In addition, the homepage background image was improved to better represent the healthcare theme of the system. Adjustments were made to image positioning, text hierarchy, typography, and color balance to ensure that the homepage appears professional, organized, and visually engaging. The final output resulted in a more polished interface aligned with the intended design standards and usability principles of the project.

Team Section Development and Interactive Contribution Feature Implementation of the e-Hiwacloy Web Reporting System

During this stage of development, the Team section of the e-Hiwacloy homepage was created and refined to properly introduce the members involved in the project. The layout was designed using structured card components containing profile images, student names, quotations, student IDs, and role labels for both the Team Leader and Team Members. Proper alignment, spacing, and placement of elements were carefully adjusted to ensure visual consistency and readability throughout the section.

The background design, card appearance, typography, image styling, and green color palette were also improved to achieve a clean and professional interface aligned with the healthcare theme of the system. Circular image formatting and consistent card dimensions were applied to strengthen the visual hierarchy and maintain design uniformity.

In addition, interactive green buttons were implemented for each team member to provide access to their individual contribution files in PDF format. The button functionality was tested to ensure that clicking the Team Leader or Team Member buttons successfully opens the corresponding PDF documentation containing their assigned tasks and project contributions. The footer section was also finalized to complete the homepage structure and improve overall interface presentation.

Data Gathering Page Development and User Interface Enhancement of the e-Hiwacloy Web Reporting System

During this phase of development, the Data Gathering page of the e-Hiwacloy web reporting system was designed and implemented to present the collected usability evaluation data and documentation in a structured and visually organized manner. The layout was developed following the established design standards used throughout the website to maintain consistency across all pages.

The page background, typography, navigation bar, and content placement were refined to improve readability and visual hierarchy. Adjustments were made to text alignment, spacing, and section positioning to ensure that the interface remains clean, balanced, and user-friendly. The navigation menu was also configured to properly highlight the active Data Gathering section, improving usability and user orientation within the website.

Overall, the Data Gathering page was successfully integrated into the web reporting system with a consistent healthcare-themed design, responsive layout structure, and improved interface presentation aligned with the objectives of the project.

Data Gathering Documentation Interface and PDF Viewing Functionality Implementation of the e-Hiwacloy Web Reporting System

During this stage of development, additional sections were implemented within the Data Gathering page to organize and present the research instruments, documentation files, and supporting materials used in the usability evaluation of the e-Hiwacloy system. The Survey Instruments section was created using card-based components containing icons, descriptions, and interactive buttons for the Heuristic Evaluation Workbook, SUS Questionnaire, and Task Scenarios.

A documentation gallery layout was also developed to organize testing photos, supporting files, and related documents in a visually structured and accessible format. Proper spacing, alignment, image placement, and consistent green-themed card styling were applied to maintain uniformity with the overall design system of the website.

	In addition, supporting document cards were integrated to provide direct access to important project files such as the Survey Response Records, Raw Response Dataset, and HCI2 Final Project Guide. Interactive buttons were configured and tested to ensure that users can properly open and view the uploaded PDF documents and datasets directly within the system. Overall, the implementation improved the accessibility, organization, and presentation of research-related materials throughout the Data Gathering section.
Respondents Visualization Dashboard and Statistical Data Presentation Development of the e-Hiwacloy Web Reporting System	During this stage of development, a Respondents Visualization Dashboard was created to visually present the demographic profile and statistical information gathered from the usability evaluation of the e-Hiwacloy system. The dashboard was designed using structured card components and graphical visualizations to make the collected data easier to understand and interpret. Summary cards containing the total population, sample size, respondents' course, and sampling method were implemented and styled using a consistent green-themed interface. Various charts such as bar graphs, pie charts, and doughnut charts were also integrated to display Age Distribution, Gender Distribution, Program Distribution, Year Level Distribution, Experience with Similar Systems, and Frequency of Technology Use. Proper spacing, alignment, and layout consistency were maintained to ensure readability and professional presentation of statistical data. In addition, a dedicated section for Slovin's Formula was implemented to visually present the sampling computation used in the study. The formula, variables, and computed sample size were organized in a structured layout to improve understanding of the statistical methodology applied in the research. Overall, the dashboard enhanced the usability and visual presentation of the Data Gathering page by transforming raw respondent information into interactive and accessible graphical representation

Survey Instruments, Documentation Gallery, and Supporting File Integration of the e-Hiwacloy Web Reporting System

During this stage of development, additional sections were implemented within the Data Gathering page to organize and present the research instruments, documentation files, and supporting materials used in the usability evaluation of the e-Hiwacloy system. The Survey Instruments section was created using card-based components containing icons, descriptions, and interactive buttons for the Heuristic Evaluation Workbook, SUS Questionnaire, and Task Scenarios.

A documentation gallery layout was also developed to organize testing photos, supporting files, and related documents in a visually structured and accessible format. Proper spacing, alignment, image placement, and consistent green-themed card styling were applied to maintain uniformity with the overall design system of the website.

In addition, supporting document cards were integrated to provide direct access to important project files such as the Survey Response Records, Raw Response Dataset, and HCI2 Final Project Guide. Interactive buttons were configured and tested to ensure that users can properly open and view the uploaded PDF documents and datasets directly within the system. Overall, the implementation improved the accessibility, organization, and presentation of research-related materials throughout the Data Gathering section.

Results and Recommendations Interface Development and Layout Enhancement of the e-Hiwacloy Web Reporting System

During this phase of development, the Results and Recommendations page of the e-Hiwacloy web reporting system was designed and implemented to present the usability evaluation findings and system recommendations in an organized and visually appealing format. The page structure was developed following the same healthcare-themed design standards used throughout the website to maintain consistency and professionalism.

The background image, navigation bar, text hierarchy, spacing, and alignment were refined to improve readability and visual balance within the interface. Adjustments were made to properly position the page title, descriptive text, and

	navigation elements to ensure a cleaner and more accessible user experience. The active Results navigation menu was also highlighted to improve user orientation and navigation throughout the system. Overall, the Results and Recommendations page was successfully integrated into the web reporting system with a consistent layout structure, organized interface presentation, and improved visual hierarchy aligned with the usability and design objectives of the project.
Results Analytics, SUS Visualization, and Presentation Development of the e-Hiwacloy Web Reporting System	During this phase of development, additional analytical and evaluation components were integrated into the Results and Recommendations page of the e-Hiwacloy web reporting system. A System Usability Scale (SUS) Results section was implemented to visually present the overall usability evaluation score and respondent distribution using graphical charts and organized dashboard components. Proper spacing, alignment, typography, and green-themed interface styling were applied to improve readability and visual consistency. A Task Completion Analytics dashboard was also developed to display respondents' task performance data gathered during usability testing. Completion time graphs and performance metric cards were integrated to provide a structured visualization of task success rate, average completion time, most time-consuming task, and fastest completed task. The graphical representations improved accessibility and interpretation of the collected usability metrics.

VERIFICATION AND ACCOUNTABILITY

I hereby certify that the information stated in this report is true and correct to the best of my knowledge. The tasks, outputs, evidence, and explanations presented herein are based on the actual contributions I performed for the completion of our group project.

PEER CONFIRMATION/GROUP VERIFICATION

We, the undersigned group members, certify that we have reviewed this Individual Narrative Report and affirm that the contributions stated herein fairly and truthfully represent the actual participation and outputs of the member in the completion of the group project. By signing below, we express our satisfaction with the reported contribution of the member.

GRADING CRITERIA: 70 points

Criteria	20 (Excellent)	12 (Good)	4 (Needs Improvement)
Number of Tasks - This criterion measures the extent of the member’s participation based on the quantity of relevant and meaningful tasks completed for the project.	The member completed many relevant, substantial, and clearly documented tasks that significantly contributed to the project.	The member completed a moderate number of relevant tasks, but the contribution is not as extensive.	The member completed very few tasks, or the tasks accomplished were minimal and limited in contribution.
Accuracy of Tasks - This criterion measures how correctly the member performed the assigned tasks in relation to the stated objectives and expected deliverables.	The tasks were completed correctly and consistently, and the actual deliverables clearly matched the objectives and expected outputs.	The tasks were generally completed correctly, but some outputs contained errors, omissions, or inconsistencies.	The tasks were inaccurate, incomplete, or poorly aligned with the stated objectives and expected deliverables.
Quality of Tasks - This criterion measures the standard, completeness, clarity, organization, and usefulness of the outputs produced by the member.	The outputs are complete, well-prepared, organized, polished, and highly useful to the group project.	The outputs are acceptable and useful, but they show some weakness in clarity, organization, completeness, or overall quality.	The outputs are poorly prepared, incomplete, disorganized, or of very limited value to the project.

Criteria	10 (Excellent)	6 (Good)	2 (Needs Improvement)
Evidence and Verification of Contribution - This criterion measures	The report contains complete, relevant, and convincing evidence that clearly supports the	The report contains some evidence and verification, but parts are	The report contains very limited evidence, weak verification, or missing signatures.

whether the contribution is properly supported by evidence and validated through required signatures.	listed tasks and deliverables, and all required signatures are complete.	incomplete, limited, or not fully convincing.	
---	--	---	--

NOTE:

- Make sure each task is specific and measurable (avoid vague entries like “helped in project”).
- Ensure that every task has matching evidence.
- Keep descriptions clear but concise.
- Use real outputs (files, screenshots, documents) as proof.
