

		UI elements to the project's global color styles.	background elements using the defined "Primary," "Secondary," and "Category" color palettes.
3	Prototype Navigation Integration	To ensure a complete and seamless user flow by connecting all screens, interactions, and navigation paths within the prototype.	The prototype initially contained incomplete and unconnected screen transitions, resulting in broken navigation and an inconsistent user experience. In this task, I assisted the team leader by systematically linking all screens, buttons, and interactive components to their corresponding destinations. This included key system flows such as appointment scheduling, cancellation, profile management, and service navigation. I identified missing connections, resolved dead ends, and ensured that every user action leads to the correct screen. The outcome is a fully functional prototype that accurately simulates real user interaction and supports a complete end-to-end navigation experience.
4	UI Styling and Effects Enhancement	To improve visual hierarchy and interface consistency by applying standardized fill, stroke,	I configured and refined the visual styling of interface components using Figma's design properties

		and shadow effects to UI components.	panel. This included adjusting fill colors, stroke settings (inside alignment, weight), and applying drop shadow effects to enhance depth and component visibility. These improvements help create a more polished and modern interface while maintaining consistency with the project’s design system. The applied effects also improve usability by making interactive elements more distinguishable.
5	Task Scenario Documentation Refinement	To improve the clarity, structure, and readability of the task scenarios adapted from the initial draft provided by De Vera.	I reviewed and refined the “Tasks and Scenario” document created by De Vera by reorganizing the content into a clear and logical task flow aligned with system functionalities. The tasks were standardized into step-by-step actions, and the scenario descriptions were clarified to better reflect real user interactions, improving overall readability and suitability for usability testing.
6	Data Gathering and Respondent Coordination	To collect reliable data and ensure smooth participation of respondents in usability testing.	I contributed to the data gathering process by distributing survey materials to respondents. I also coordinated with participants to ensure their availability and participation, helping facilitate an organized and

			efficient usability testing process.
7	Survey Documentation and Photo Capture	To document the usability testing process and provide visual evidence of survey implementation.	I was responsible for documenting the survey process by taking photos during the actual conduct of usability testing. These images captured participant engagement, material distribution, and the overall data gathering environment. This documentation serves as supporting evidence of the research process and ensures transparency and credibility in the study.
8	Survey Form Organization	To organize survey forms based on schedule/date	Separated the survey forms according to their respective dates to ensure proper tracking and easier data management.
9	Website Homepage Development	To create an initial interface for the system	Designed and developed the homepage of the system using Visual Studio Code, including layout, navigation bar, and basic structure of the website.
10	Data Recording	To create an initial interface for the system	Recorded each response from the survey forms accurately to prepare for analysis and ensure completeness of data.
11	Team Profile Card Enhancement and Information Integration	To improve the visual presentation and completeness of the team profile section within the homepage interface.	The team profile cards for both the Team Leader and Team Members were enhanced by adding circular border styling around the profile images to improve emphasis and visual consistency.

			Additional profile information such as student IDs and personal quotations were also collected and integrated individually into the interface to provide a more complete and professional presentation of the development team.
12	Team Section Theme and Layout Consistency Improvement	To maintain consistent visual design and alignment across all pages of the web reporting system.	Adjustments were made to the background design, color palette, spacing, and alignment of the Team section to ensure consistency with the established green-themed interface used throughout the website. The layout structure and placement of profile elements were refined to achieve a cleaner and more balanced presentation aligned with the other pages of the system.
13	Data Gathering Documentation Collection	To collect and organize all necessary photos and visual materials used during the data gathering and usability evaluation process.	Documentation images related to the usability testing and data gathering activities of the e-Hiwacloy system were collected and organized for inclusion within the web reporting system. The collected photos will serve as supporting evidence and visual

			documentation of the evaluation process conducted during the study.
14	Documentation Image Preparation and Submission	To prepare organized documentation materials for integration into the project documentation and reporting pages.	The collected documentation photos were reviewed and prepared for submission to the team leader for integration into the website and project documentation. Images were categorized based on their relevance to testing activities, supporting files, and related research documentation.
15	Documentation Description Writing Preparation	To prepare descriptive captions and explanations for each collected documentation image.	Initial preparation was conducted for creating short descriptions and captions for every collected documentation photo. These descriptions are intended to explain the purpose and context of each image within the usability evaluation and data gathering process of the e-hiwakloy system.

EVIDENCE OF CONTRIBUTIONS:

This section provides proof of the tasks I completed. Each piece of evidence corresponds to a specific task listed above.

Note: All evidence should be properly labeled

Screenshot/Images	Descriptions
-------------------	--------------

Header & Navigation Alignment:
This image shows the modification of the "Appointment Details" screen. The typography and green primary color were adjusted to match the leader's specific style guidelines for a cohesive user experience.

Component Color Mapping:
This image showcases the component library (buttons and inputs). I modified these to strictly follow our defined Color Styles (seen in the right sidebar), ensuring that every button state (Reschedule, Cancel) uses the correct hex codes.

Prototype Navigation Connection:
This image shows the fully connected prototype where all screens are linked through interactive flows. Previously unconnected elements were fixed to ensure smooth transitions and eliminate navigation errors.

UI Effects and Styling Configuration:
This image highlights the design properties panel where fill color, stroke (inside alignment and weight), and drop shadow effects were applied. These adjustments enhanced the visual clarity, depth, and consistency of UI components across the prototype.

Task Scenario Structuring:
This image shows the revised "Tasks and Scenario" document. The task flow was reorganized into a clear, sequential format, ensuring that each user action is logically arranged and easy to follow.

Scenario Content Refinement:
The scenario descriptions were edited for clarity and completeness, making them more aligned with actual user behavior and system functionality.

Data Gathering Process:
This image highlights the distribution of materials and coordination with respondents during the data collection phase.

Survey Conduct Documentation:
This image shows the actual usability testing session, where respondents are answering the survey questionnaires.

Participant Engagement:
This image highlights participants actively engaging with the provided materials during data collection.

Shows the HTML structure of the homepage, including the navigation bar, logo, and overall layout design.

Shows the actual browser output of the homepage, emphasizing the “Usability Study Process” banner and the implemented user interface design.

Organized the survey forms according to their respective dates to ensure accurate tracking and efficient data management.

Team Member Card Enhancement Interface

The images show the updated team member profile cards of the e-Hiwacloy web reporting system. Circular border styling was applied around the profile images to improve visual emphasis and consistency within the interface. Student IDs and personal quotations were also individually collected and integrated into the profile cards to provide more complete information about each team member. The section background, spacing, and green-themed color styling were refined to maintain consistency with the overall design and layout of the website.

Documentation Gallery Preparation Interface

The image shows the documentation gallery section prepared for organizing photos during data gathering, supporting files, and related research documents of the e-Hiwacloy web reporting system. The interface was structured using organized image cards and categorized layouts to improve accessibility, visual presentation, and organization of collected documentation materials that will be integrated into the project website and reports.

WORK PROCESS

This section explains how I carried out each assigned task, including the steps I followed and how I contributed to the group’s overall output.

Task	Process
Standardizing Screen Headers	I reviewed the team leader's master design to identify specific font weights, hex codes, and spacing. I then applied these attributes to the "Appointment Details" header to eliminate design debt and ensure the user feels they are in the same app.
Applying Global Color Styles	I audited the existing components (like the "Cancel Appointment" buttons) and replaced "detached" or custom colors with the project's official Color Styles. This allows for project-wide updates if the theme changes and keeps the UI consistent across all vaccination and maternal care modules.

Connecting Prototype Screens	I reviewed the entire prototype to identify unconnected frames and broken interaction paths. Using Figma’s prototyping tools, I linked buttons, icons, and interactive elements to their correct destination screens. I ensured that all user flows such as booking, canceling, and navigating services were complete and functional without dead ends.
Applying UI Styling and Effects	I utilized Figma’s design panel to configure component styles, including fill colors, stroke properties, and shadow effects. I ensured that all applied styles align with the project’s visual guidelines and contribute to a cohesive and user-friendly interface. Careful adjustments were made to balance aesthetics and usability, ensuring that elements are visually distinct without overwhelming the overall design.
Refining Task Scenario Document	I analyzed the original document created by De Vera and identified areas where the structure and wording could be improved. I reorganized the task sequence into a logical order and refined the descriptions to ensure clarity and consistency. I also ensured that all major system functionalities were properly represented in the task list, making the document more effective for guiding usability testing.
Data Gathering and Coordination	I distributed the survey materials to respondents. I also coordinated with participants to ensure their involvement and smooth execution of the usability testing process.
Survey Documentation	During the usability testing, I captured photos of the survey process, ensuring that key activities such as distribution of materials and participant responses were documented. I made sure that the images clearly represent the actual implementation of the study while maintaining an organized and professional record of the data gathering phase.

Survey Form Organization	Identified different survey schedules → Grouped forms based on date → Ensured proper labeling for each batch
Data Recording	Collected responses → Encoded data into a structured format → Checked for completeness and accuracy
Website Development	Opened project in Visual Studio Code → Created HTML structure → Linked CSS file → Designed homepage layout → Previewed in browser and adjusted design
Team Profile Section Refinement and Interface Consistency Enhancement of the e-Hiwacloy Web Reporting System	During this phase of development, the Team profile section of the e-Hiwacloy homepage was further refined to improve visual quality, consistency, and completeness of member information. Circular border styling was added around the profile images of both the Team Leader and Team Members to create stronger visual emphasis and achieve a more professional card presentation. Additional member details such as student IDs and personal quotations were individually collected and integrated into each profile card. Proper placement, spacing, and alignment of these elements were carefully adjusted to maintain readability and organized presentation within the interface. Furthermore, refinements were made to the background design, color palette, and overall layout structure of the Team section to ensure consistency with the visual theme and formatting used across the other pages of the web reporting system. These improvements enhanced the professionalism, uniformity, and user experience of the homepage interface while maintaining alignment with the established healthcare-themed design standards of the project.
Data Gathering Documentation Collection and Organization of the e-Hiwacloy Web Reporting System	During this phase of development, preparations were conducted for collecting and organizing the documentation materials related to the data gathering and usability evaluation activities of the e-Hiwacloy system. Necessary photos taken during the testing and evaluation process were gathered to

serve as supporting visual evidence for the project documentation and web reporting system.

The collected images were reviewed and categorized according to their purpose, including photos during testing, supporting files, and related research documentation. These documentation materials were prepared for submission to the team leader to support the completion and integration of the documentation gallery section within the website.

In addition, preparations were initiated for creating short descriptions and captions for each documentation image. These descriptions are intended to explain the context, activities, and purpose shown in every photo related to the data gathering and usability evaluation process. Overall, this task supports the completeness, organization, and professionalism of the documentation section of the e-Hiwacloy web reporting system.

PEER CONFIRMATION/GROUP VERIFICATION

We, the undersigned group members, certify that we have reviewed this Individual Narrative Report and affirm that the contributions stated herein fairly and truthfully represent the actual participation and outputs of the member in the completion of the group project. By signing below, we express our satisfaction with the reported contribution of the member.

GRADING CRITERIA: 70 points

Criteria	20 (Excellent)	12 (Good)	4 (Needs Improvement)
Number of Tasks - This criterion measures the extent of the member’s participation based on the quantity of relevant and meaningful tasks completed for the project.	The member completed many relevant, substantial, and clearly documented tasks that significantly contributed to the project.	The member completed a moderate number of relevant tasks, but the contribution is not as extensive.	The member completed very few tasks, or the tasks accomplished were minimal and limited in contribution.
Accuracy of Tasks - This criterion measures how correctly the member performed the assigned tasks in relation to the stated objectives and expected deliverables.	The tasks were completed correctly and consistently, and the actual deliverables clearly matched the objectives and expected outputs.	The tasks were generally completed correctly, but some outputs contained errors, omissions, or inconsistencies.	The tasks were inaccurate, incomplete, or poorly aligned with the stated objectives and expected deliverables.
Quality of Tasks - This criterion measures the standard, completeness, clarity, organization, and usefulness of the outputs produced by the member.	The outputs are complete, well-prepared, organized, polished, and highly useful to the group project.	The outputs are acceptable and useful, but they show some weakness in clarity, organization, completeness, or overall quality.	The outputs are poorly prepared, incomplete, disorganized, or of very limited value to the project.

Criteria	10 (Excellent)	6 (Good)	2 (Needs Improvement)
Evidence and Verification of Contribution - This criterion measures whether the contribution is properly supported by evidence and validated through required signatures.	The report contains complete, relevant, and convincing evidence that clearly supports the listed tasks and deliverables, and all required signatures are complete.	The report contains some evidence and verification, but parts are incomplete, limited, or not fully convincing.	The report contains very limited evidence, weak verification, or missing signatures.

NOTE:

- Make sure each task is specific and measurable (avoid vague entries like “helped in project”).
- Ensure that every task has matching evidence.
- Keep descriptions clear but concise.
- Use real outputs (files, screenshots, documents) as proof.
